

Tercero South Thermostat User Guide - Heating

Tercero South Housing buildings are equipped with Telkonet EcoSmart Thermostats. These thermostats provide increased energy efficiency by monitoring room occupancy and adjusting room temperatures accordingly based on pre-set temperature limits.

Residents/guests can select a comfortable heating temperature between 58 – 70 degrees or may choose to turn off their heating.

For maximum efficiency and increased energy savings, the EcoSmart thermostats are constantly monitoring occupancy in each room.

While in heating mode, if a resident/guest is away from their room for more than 30 minutes, the system will react by reducing heating and allowing a temperature drop of no more than 6 degrees (or whatever it can make-up in 12 minutes). Once the resident/guest returns the system will return to the desired set-point and maintain that set-point within 2 degrees as long as the room remains occupied.

While in heating mode, if a resident/guest is away from their room for more than 48 hours, the system will react by reducing heating and allowing a temperature drop of no more than 12 degrees (No lower than 58 degrees or whatever it can make-up in 30 minutes). Once the resident/guest returns the system will return to the desired set-point and maintain that set-point within 2 degrees as long as the room remains occupied.

The system does include a self-protection mode and will automatically turn itself on (if not in heating mode) and begin heating if temperatures in the room drops below 55 degrees.

Troubleshooting:

Room is Too Cold

1. Look for the flame icon – is Heating on?
If not, toggle the switch on the bottom right until the flame icon appears on bottom left.
Note: Residents/Guests of Tercero South may toggle between off and heat modes.
2. Has the room been unoccupied for an extended amount of time?
 - a. Once occupied, allow the room up to 12 minutes to meet the desired set-point.
 - b. If the room was unoccupied for the previous 48 hours, this could take up to 30 minutes.
3. Are the windows open?
 - a. If outside temperatures are cooler than inside temperatures, close all windows to allow maximum efficiency.
 - b. If outside temperatures are warmer than inside temperatures, open windows to allow increased heating.

If the above actions do not resolve the problem, please submit a request on-line.
